

Course Content

The Lower Secondary Global Perspectives programme helps learners to lay the foundation for lifelong learning. Students will learn and develop six different skills throughout the year which are research, analysis, evaluation, reflection, collaboration and communication. These skills can be applied in further education and the workplace.

In term three, we aim to further develop students' curiosity of the world around them to create an enthusiasm for learning. Students will learn and practice the skills discussed through the learning and investigation of two main topics, Digital World and Belief Systems. These two new topics focus mainly on giving students a deeper understanding of the forever developing technology in the modern world as well as the different religious, political and philosophical beliefs humans follow globally. This is a very relevant and interesting part of the subject as students can foresee the future of learning and development. The lessons are designed and executed to make learning about the world fun and entertaining, as well as educational and developmental.
